INNOVATION

Artificial Intelligence

Baker Donelson stands at the forefront of legal innovation, distinguished by our early and strategic adoption of machine learning and generative artificial intelligence (AI) technologies. We're not just using AI – we're redefining what it means to deliver legal services in the 21st century.

For years, our Firm has been a leader in exploring and implementing some of the legal industry's most advanced AI solutions across transactional, litigation, and regulatory compliance applications. Today, we deploy a robust suite of machine learning and generative AI tools that empower our attorneys to:

- Draft legal documents with greater speed and accuracy
- Streamline contract lifecycle management – from contract intake and tracking to document review and data extraction
- Accelerate transactional workflows and due diligence
- Conduct more strategic and efficient legal research

We have also integrated AI tools Firm-wide, giving our attorneys and professional staff at every level access to approved AI solutions that enhance accuracy, consistency, and productivity across all operations. By automating routine tasks, we free up time and resources for what matters most: crafting sound legal strategies, seeing the broader business context, and helping our clients achieve their goals.
